

Use a large clip for large tubes like hand cream.

A medium size clip works well for toothpaste and denture hold

An Improved Method For Squeezing Material Out Of A Tube

- 1-As material is squeezed out of the tube roll up the end.
- 2-Use a paper binding clip to prevent the tube from unrolling.
- 3- When the roll gets too big for the clip, remove the clip, unroll the roll and using scissors cut off some of the tube. Leave enough of the tube so you can fold over the end to prevent material from being squeezed out of the cut end.
- 4- Start the roll again. Put the clip back on. Wipe off any material that may have come out of the cut end.
- 5- Buy clips where office supplies are sold.
